OptiSynx Limited

Company Profile

Clocks form the core of all communications networks. Higher accuracy is being demanded from core to edge. OptiSynx have a time and synchronisation source that offers advantages over existing solutions.

Description of services/products.

Prototypes of our first product, the OptiBox, will soon be available for advance evaluation. OptiBox, launched a year later will be of similar price to the alternatives such as Rubidium/GPS, but with the performance of Caesium and many other advantages such as cost of ownership, ruggedness, lifetime. Future products will see form factor and cost reduced by orders of magnitude allowing for a revolution in how networks are synchronised.

Your Company's Value Proposition

Telecommunications networks evolved around the timing sources that were available. Time distribution is increasingly inadequate and causing problems and bottlenecks in future network development. The price / performance point of OptiSynx range of products is able to offer a solution.
